OPERATING INSTRUCTIONS

SPECIFICATIONS

Frequency Response: See curve.

Discrimination: See curve.

Output Level with various loads:

Unbalanced—

- High impedance (10,000 ohms or higher)
  -35 db re 1 v, 10 dynes/cm² (voltage)
- 600 ohms, —54 dbm re 10 dynes/cm²
- 150 ohms, —58 dbm re 10 dynes/cm²
- 30 ohms, —64 dbm re 10 dynes/cm²

Balanced—(Using 4665 plug-in transformer)
- 600, 150 or 30 ohms, —53 dbm re 10 dynes/cm²

Power Requirements: 117 v, 60 cycles, 15 watts

Physical:
- 525A Power Supply, width 8¾”, height 2¾”, depth 7½”.
- Finish—29A microphone, stainless steel; 175A base—gray anodize; 525A Power Supply—silver gray cover with gray anodized panel.
- Mounting—166A holder attachment or 169A Shock Mount, both threaded 8/32”—27 to mate with 22C Floor or 24C desk stand or other standard microphone stand.
- Weight—M30 System (unpacked)—6 lbs. 11 oz.

ACCESSORIES

4665 Plug-in Transformer for balanced output line.

167A Extension Cable 25 ft. long equipped with Cannon RWK 6-22C and RWK 6-21C connectors.

170A Wind Screen clamps between microphone and base; OD 1½”, 2½” long.

22C floor stand, adjustable 35” to 64”.

24C desk stand.

11853 Rack Mounting Assembly for two 525 power supplies, 3½ inches high x 19 inches wide x 7½ inches deep. Finish, green.
GENERAL DESCRIPTION
The "Lipstick" microphone system is designed to work with any existing microphone preamplifier regardless of the input impedance. Aside from the outstanding advantages of this microphone, it differs from the conventional only that the 525A Power Supply must be connected between microphone and amplifier. The 175A Base, containing the 5840 vacuum tube and 29A Microphone, is terminated at the end of a 15 foot cable in a Cannon connector which mates with a fitting on the 525A. Extension cables are described below. A 15 foot 2-conductor shielded output cable is attached to the power supply. The power supply must be energized from the 117 v 50-60 cps supply.

The 166A slip-in Holder of high impact Styrene mounts the 175A Base and provides a light streamlined swivel attachment with 5/8"-27 thread for floor or desk stand.

The 169A Shock Mount, also equipped with swivel and 5/8"-27 thread, insulates the microphone effectively from noises transmitted through the floor stand or microphone boom.

The 170A Wind Screen designed for maximum wind and blast protection and for minimum interference with the excellent response of the microphone, clamps between the microphone and the base. Its use is suggested in outdoor applications, or when the microphone is subjected to movement on a boom mount, or to protect against blast in any close talking use.

OUTPUT CONNECTIONS
Unbalanced:
As supplied, the 525A Power Supply is equipped with a plug installed in the transformer socket which connects the output cable to the cathode follower, through isolating resistor and condenser, for use when the following amplifier has a high impedance or unbalanced (transformerless) input. It may also be operated into amplifiers having low impedance input connections where line balance is not of importance and a small reduction of sensitivity can be tolerated. When the plug is inserted, the black-white wire of the output cable is grounded, thus is common with the shield. The unbalanced output (no 4665 transformer) requires termination when working into transformer loads of 600 ohms or less. A 1/2 watt resistor matching the transformer impedance within ± 20% should be connected across the power supply output. This may be installed in the connector which the user will attach to the output cable.

Balanced:
Broadcast and recording applications normally require balanced or ungrounded lines for suppression of longitudinal noise currents. This feature is provided by means of a plug-in transformer (4665) which may be inserted in the 525A (installation instructions are given under 525A Power Supply). As shipped the socket is strapped to provide a load impedance of 150 ohms. Other load impedances of 30 and 600 ohms may be obtained by re-strapping the socket as indicated on the transformer schematic. Because of the great latitude in loading permitted by the cathode follower, it is suggested that all load impedances between 30 and 250 ohms be fed from the 525A without modification of the transformer socket strapping. When the 4665 balancing transformer is used, no termination other than that provided by the input transformer of the following amplifier is required.

SENSITIVITY
The voltage developed at the grid of the first tube following the 525A power supply, for a given microphone signal input, will be identical for all balanced line impedances where the amplifier input is matched, using the 4665 transformer. It will have the same value when the unbalanced (direct cathode follower) output is fed into the first tube of an amplifier not having an input transformer. However, when the unbalanced output is fed into low impedance transformers and loaded with a resistor, as described under UNBALANCED OUTPUT CONNECTIONS, the sensitivity will vary depending upon the load impedance. With a 600 ohm resistor termination working into a 600 ohm transformer, the voltage will be comparable to the above; with a 150 ohm resistor and 150 ohm transformer, the voltage will be 4 db lower and with a 30 ohm resistor and 30 ohm transformer the voltage will be 10 db lower. These sensitivities are listed in the specifications relative to microphone inputs of 10 dynes/cm².

EXTENSION CABLE
The cable length supplied with the 175A Base is 15 feet. Heavy duty, 25' extension cables are available as listed, or single lengths of Surprenant 5426 or equivalent six-conductor cable may be utilized to separate microphone base and power supply up to 400 feet. Beyond 400 feet, larger conductors should be used for the heater loads to avoid excessive voltage drop.

29A MICROPHONE
The condenser microphone produces voltages in response to sound pressure through the variation of capacitance between moving diaphragm and a stationary electrode connected to a source of polarizing voltage through an extremely high resistance. For the 29-A, the potential is 60 volts and the charging resistance is the input resistance of the associated vacuum tube. The output is proportional to the diaphragm displacement independent of frequency for all frequencies above those at which the microphone reactance is commensurate with the charging resistance. The capacitance of the condenser is approximately 50 mmuf. Because of this high internal impedance, it is necessary to place the cathode follower tube, which serves as an impedance transformer, in close proximity to the microphone.

To achieve a uniform cardioid characteristic the sound pressure acting on the backside of the diaphragm passes through a multiple acoustical phase-shifting network. This network allows optimum phase shift adjustment over the whole frequency range. To provide this effect the diaphragm is made of 0.0025 Mylar, gold plated and stretched to a resonance frequency of approximately 1500 cps. The movement of the diaphragm is resistance controlled by the thin air film between diaphragm and backplate. Due to the low resonance frequency the applied polarizing voltage may not exceed 60 v. Higher voltages may cause the diaphragm to collapse on the backplate and the microphone to become inoperative, although undamaged.

175A BASE
The base performs the multiple purpose of mounting the microphone, housing the tube, and enclosing the cable connections to the tube. The inner structure of this assembly employs a printed circuit phenolic sleeve which supports the tube socket, providing solder terminating areas for cable wires and tube socket tabs, as well as providing the interconnecting wiring between socket and cable. The gold plated contact pin at the apex of the assembly is supported by a phenolic bearing cemented into the center hole of the socket and is connected to the grid by means of the compression spring which surrounds the pin. The cable clamp assembly consists of a special "O" ring, a brass washer, the clamping nut which completes the case contour, and a gold plated brass part which supports the printed circuit sleeve and provides threads for mating the outer shell with the clamping nut. The cable cover and ground wire solder to the brass part and complete the connection to the microphone case through the gold clad aluminum shell. The Tensolite 1883-H6 cable which is part of the brass and is a six-conductor shielded wire of small diameter and good flexibility, having an overall jacket of woven fiberglass material providing excellent abrasion resistance. The Cannon RWK-6-22C connector contains a 1/4 W 22 K deposited carbon resistor which establishes the polarizing voltage of 60 v. This resistor is the only basic difference between the 175A and the 165A Base used with 21-type microphones.

525A POWER SUPPLY
This unit, by means of a transformer, dry disc rectifiers and filters, supplies direct current potentials for operation of the 5840 cathode follower tube and condenser microphone in the 175A base. The locations of components are shown in the accompanying photographs. The shorting plug indicated must be removed when the line balancing transformer is used. When the transformer is inserted, two holes in the chassis line up with threaded inserts in the transformer. The transformer should be secured to the chassis using the two screws furnished.
MODIFICATION
Of M20 System for the use of the 29A Microphone:
The 29A Microphone requires a 60 v polarizing voltage, as compared with 200 v for the 21D Microphone. M20 Systems may be modified in any of three ways to provide the 60 v polarizing voltage:

1.) Parallel resistor R4 in the 525 with a 22,000 ohm 1/2 watt deposited carbon resistor.
2.) Solder the resistor between pins 4 and 6 of the Cannon Connector RWK-6-22C terminating the cable of the 165A Base. This modification converts the 165A to a 175A Base.
3.) Insert, in the microphone cable, an adaptor consisting of an RWK-6-22C and an RWK-6-21C connected together with the resistor connected as in (2).

SERVICE DATA:
Caution: when removing the cover from the 525A power supply or the outer shell from the 175A Base, disconnect the power supply from the power line. The metal condenser cans in the power supply are at a positive potential to ground and require approximately two minutes to lose the charge after the system is disconnected. If the system fails to operate and the pilot lamp does not glow, check power line connection and fuse located inside the chassis. If system operates but produces loud hum when the base or microphone is touched, it is an indication of a poor ground connection between the microphone case and the cable end of the assembly. To correct, tighten microphone and shell.

If the system is inoperative, but the power supply is producing normal heater and B supply voltages, the potential across R4 should be measured. R4 is the cathode load resistor for the 5840 tube in the 175A base. With the base disconnected from the power supply, no potential should exist. With the base connected and the microphone button either on or off of the base, the potential across R4 should be a nominal 60 volts. If this potential is not obtained, the 5840 vacuum tube is faulty or a cable short or open exists. If the 60 volts is obtained with the microphone button removed from the base, but not when it is connected, the microphone backplate has accumulated moisture. This sometimes occurs when the microphone has been stored in atmospheres approaching 100% humidity. The condition will sometimes correct itself in a short time due to the heating effect of the vacuum tube. If not, the microphone button can be removed from the base and placed in a ventilated 100° F. oven for a period of several hours.

The shell of the 165A base may be easily removed for inspection by holding firmly the knurled cable clamp nut and unscrewing the upper shell and microphone. It is recommended that the microphone not be removed from the base unless absolutely necessary. When it is removed, fingers and dirt should be kept away from the back plate surface and the breath, which contains moisture, should not be used to blow the assembly clean. The 5840 vacuum tube is a premium type designed for dependable performance under conditions of shock and vibration. On withdrawing the tube, the tip end should be depressed into the sleeve until the pins clear the socket allowing it to be tilted out of the socket. When re-inserting the tube, the same procedure should be used, entering the tip end of the sleeve first and depressing until the pins clear the opening, allowing alignment with the socket. When the shell is removed from the base, extreme care should be exercised to protect the spring loaded contact pin at the apex of the assembly from damage. Before reassembling, the vinyl insulator surrounding the soldered tube socket connections should be checked, as this is the only insulator between this point and the outer shell. The cable attached to the base may be replaced in the field, if necessary. The cable clamp is released by holding the upper gold plated brass part by means of a length of 1/8 inch diameter drill rod entered in the radially located hole and unscrewing the knurled nut using pliers with padded jaws. Connections to the printed circuit may be soldered using a minimum of heat and preferably using low temperature solder for the purpose such as National Lead Co. No. 604-AG. When reassembling the clamp, the 1/8" diameter drill rod serves also as a gauge, the knurled aluminum nut being tightened until it touches the rod.
The Altec M-30 Cardioid Condenser Microphone System represents a truly new standard for quality in directional microphones. It has all of the smooth, extended frequency response characteristics and damage resistance normally associated with Altec condenser microphones, and it has a directional cardioid pattern that is outstanding in its discrimination. In addition it has the advantage of extremely small size.

The frequency range is from 20 to 20,000 cycles, being down only 3 db at 50 cycles and flat to beyond 18,000 cycles. Midrange discrimination exceeds 20 decibels and discrimination at the extremes of the frequency range is better than 10 db.

Heart of the M-30 system is the 29A Condenser microphone. It is interchangeable with the omnidirectional 21 type microphone in existing M-20 systems with only minor modifications to the associated equipment.

The 29A is attached to the 175A Base which houses a premium performance subminiature impedance matching tube and provides interconnection between the 29A and the 525A Power Supply. The 175A Base is supplied with fifteen feet of abrasion resistant fibreglas microphone cable.

Completing the system is the 525A Power Supply which provides the necessary voltages to the impedance matching tube and the 29A microphone, the 166A slip-on stand attachment with swivel base, and the 169A Shock Mount Stand Holder for use in critical recording and pick-up conditions.

The M-30 Microphone System will be found superior to all others for its small size, regularity of discrimination and smoothness of frequency response. It is the first miniature directional microphone capable of translating the entire frequency and dynamic range without false accentuations.
THE M-30 MICROPHONE SYSTEM CONSISTS OF:

29A Microphone
Type: Condenser
Directivity: Cardioid
Frequency Range: 20 to 20,000 cps
Frequency Response: See curve
Discrimination: See curve
Hum: Not susceptible to magnetic fields
Capacitance: 50 mmf
Dimensions: 3/4" Diameter, 3/4" Seated Height
Finish: Stainless Steel

175A Base
Dimensions: 3/4" Diameter, 2 3/4" Long
Tube: 1 type 5840
Finish: Anodized gray

166A Stand Attachment
Mounting: 5/16" — 27 thread
Finish: Gray plastic

169A Shock Mount
Mounting: 5/16" — 27 thread
Finish: Gray

525A Power Supply
Power Requirements: 117 volts, 60 cycles, 15 watts
System Output Level from Power Supply:
Unbalanced:
High Impedance (10,000 ohms or higher) — 35 dbm/10 dynes/cm² (open circuit voltage)
600 ohms — 54 dbm/10 dynes/cm²
150 ohms — 58 dbm/10 dynes/cm²
30 ohms — 64 dbm/10 dynes/cm²
Balanced:
Using 4665 Plug-in Transformer for 30, 150 or 600 ohms — 53 dbm/10 dynes/cm²
Load Impedance:
30, 150, 600 balanced (using 4665 Transformer)
30, 150, 600, 10,000 ohms unbalanced
Dimensions: 2 3/16" H, 8 5/16" W, 7 1/2" D
Finish: Gray anodized panel, silver gray case

ACCESSORIES (order separately as required)
170A Wind Screen (clamps between microphone and base) Diam: 1 1/8" Max. Length: 2 1/2"
4665 Plug-in Transformer for balanced output line
167A Extension Cable 25 feet long equipped with Cannon RWK 6-22C and RWK 6-21C cable connectors.
1883-H Cable—slim Fiberglass covered cable as supplied with 165A Base
11853 Rack Mounting Assembly for two 525A Power Supplies. Rack Space: 3 1/2". Finish: Green.

ARCHITECTS AND ENGINEERS SPECIFICATIONS

The microphone system shall be of the condenser type with a cardioid directional pick-up pattern. To insure stable operation, it shall not employ oscillator/demodulator or other means requiring radio frequencies. Frequency response shall be uniform from 20 to 20,000 cps. A cathode follower circuit shall be in close proximity to the microphone and the entire assembly shall not be greater than 3/4" in diameter and 3 1/2" in length. Weight of the microphone shall not exceed 2 ounces. Larger microphones which tend to obstruct view of the user will not be acceptable under this specification.

Output level shall be at least (choose one) (a) — 54 dbm when terminated by 600 ohms and unbalanced, (b) — 58 dbm when terminated by 150 ohms and unbalanced, (c) — 64 dbm when terminated by 30 ohms and unbalanced, (d) — 53 dbm when terminated by a nominal impedance and balanced with respect to ground. The cardioid directional microphone shall provide at least 20 db front to back discrimination throughout the entire mid-range and shall have at least 10 db front to back discrimination at the frequency extremes. It shall be Altec Lansing Model M-30 Cardioid Condenser Microphone System.
